comprise a human derived promoter or mammalian homologue and sequence acceptance site that is designed to directionally accept sequence specific products from RT-PCR based cloning strategies via a unique site within an interrupted palindrome recognition sequence for a restriction endonuclease which is incorporated into the PCR ptimer. In this embodiment, the palindrome recognition requence is for Bgll. The 5' acceptance site is given in AAV21735. The novel vectors are used to express target antigens, especially tumour antigens. They are non-replicating in mammalian cells but are capable of extended stable expression of target sequences, and emmune responses to the target sequences with little or no immune response to the other vector components.
polynucleotide vectors such as pITL (see AAV21724).
                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 11 BP; 2 A; 3 C; 4 G; 2 T; 0 other;

This invention describes a novel method for the production of a Production of polypeptide in Bacillus using specific promoters, particularly for producing enzymes Example 18; Page 35; 90pp; English.

polypeptide in Bacillus using specific tandem or consensus promoters. The method is used to produce homologous or particularly heterologous proteins, particularly enzymes (specifically serine protease, maltogenic alpha-amylase and pullulanase), but also hormones, antibodies, reporters etc. The specified promoters provide increased expression of the sequence which encodes the polypeptide of the invention. After incorporation of the nucleic acid construct of the invention, any marker gene may be deleted, resulting in a cell that is preferred for environmental and regulatory regions. This sequence represents a PCR primer used to amplify the Bacillus amyloliquefaciens consensus amyQ promoter.

The present invention relates to a method for producing a polypeptide, comprises cultivating a Bacillus cell, which contains a nucleic acid construct comprising a tandem promoter and consensus promoters. The Bacillus is cultivated in a medium conducive for the production of the polypeptide. Bach promoter sequence of the tandem promoter is operably linked to a nucleic acid sequence encoding the polypeptide. The tandem promoter comprises amyt promoter, amyQ promoter, apry promoter, crylIIA promoter, amyQ promoter, apry promoter, crylIIA promoter, cultivation consensus promoters of the amyL promoter, amyQ promoter, apry promoter, crylIIA promoter or subtilisin Carlsberg gene promoter have the sequence TTGACA for the -35 region and TATAAT for the -10 region. The method further comprises isolating the polypeptide from the cultivation medium. The method is useful for producing a polypeptide in a Bacillus strain. The present sequence is a PCR primer used in the construction of a consensus mutated Bacillus amyloliquefaciens alpha-amylase (amyQ) consensus mutated Bacillus amyloliquefaciens alpha-amylase (amyQ) stream region of the amyQ promoter, used in the exemplification of the invention.

                                                                                                                                                                                                                                                                                                                          Novel isolated polypeptide having pectin acetylesterase activity useful for degrading pectic substances and in degradation or modification of acetylated pectins and plant cell walls .
                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to Bacillus subtilis pectin acetylesterase protein. The invention is useful for degrading a pectic substance. It is also useful for degrading soluble and insoluble pectins with varying degrees of esterification, clarification etc. The protein may be used alone or in combination with other enzymes for the degradation or modification of acetylated pectins, degradation or modification of plant cell walls.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Bacillus amyloliquefaciens short consensus amyQ promoter PCR primer 1.

This invention describes a novel method for the production of a polypeptide in Bacillus using specific tandem or consensus promoters. The method is used to produce homologous or particularly heterologous proteins, particularly enzymes (specifically serine protease, maltgenic alpha-amylase and pullulanase), but also hormones, antibodies, reporters etc. The specified promoters provide increased expression of the sequence which encodes the polypeptide of the invention. After incorporation of the nucleic acid construct of the invention, any marker gene may be deleted, resulting in a cell that is preferred for environmental and regulatory regions. This sequence represents a PCR primer used to amplify the Bacillus amyloliquefaciens short consensus amyQ promoter which is gene expression cassette.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

                                                                                                                                                              This invention describes a novel method for the production of a polypeptide in Bacillus using specific tandem or consensus promoters. The method is used to produce homologous or particularly heterologous proteins, particularly enzymes (specifically serine protease, maltogenic alpha-amylase and pullulanase), but also hormones, antibodies, reporters alpha-amylase and pullulanase), but also hormones, antibodies, reporters which encodes the polypeptide of the invention. After incorporation of the nucleic acid construct of the invention, any marker gene may be deleted, resulting in a cell that is preferred for environmental and regulatory regions. This sequence represents a PCR primer used to amplify the Bacillus amyloliquefaciens short consensus amyQ trimer promoter. Which savannasE(RTM) gene expression cassette.
                                                                                                                                                                                                                                                                                                                                                                                                                     0;

The present invention relates to a method for producing a polypeptide, comprises cultivating a Bacillus cell, which contains a nucleic acid construct comprising a tandem promoter and consensus promoters. The Bacillus is cultivated in a medium conductve for the production of the polypeptide. Each promoter sequence of the tandem promoter is operably planked to a nucleic acid sequence encoding the polypeptide. The tandem promoter comprises anyl promoter, any promoter, aprh promoter, cryllin promoter or subtilisin Carisberg gene promoter. The consensus promoters or subtilisin Carisberg gene promoter. The consensus promoters or subtilisin Carisberg gene promoter aprh promoter Troack for the "35 region and TATAAT for the "10 region. The method further comprises isolating the polypeptide from the cultivation medium. The method is useful for producing a polypeptide in a Bacillus strain.
Primers termISFi and 21Sfi (see AAV82419-20) were used for the PCR amplification of the promoter region of the TERMAMYL amylase amyl gene of Bacillus amyloliquefaciens. Primer termISFi was used to add an Sfil site to the 5' end of the promoter. The Bacillus APT/O procease gene (see AAV82382) in vector pSJ2882-MCS, useful in detergent compositions and in leather processing. Host cells, vectors and methods for recombinant production of the

The present invention relates to a method for producing a polypeptide, comprises cultivating a Bacillus cell, which contains a nucleic acid construct comprising a tandem promoter and consensus promoters. The Bacillus is cultivated in a medium conducive for the production of the polypeptide. Each promoter sequence of the tandem promoter is operably linked to a nucleic acid sequence encoding the polypeptide. The tandem promoter comprises amyL promoter, amyQ promoter, aprH promoter, crylIIA promoter comptises amyL promoter, amyQ promoter, aprH promoter, crylIIA promoter, containing the promoter, crylIIA promoter, containing the promoter, aprH promoter, crylIIA promoter, containing the polypeptide from the cultivation medium. The method is useful for producing a polypeptide in a Bacillus strain.

The present sequence is a PCR primer used in the construction of a short consensus mutated Bacillus amyloliquefaciens alpha-amylase (amyQ) dimer promoter gene expression cassette, used in the exemplification of
                                                                                                                                                                               ö
The present sequence is a PCR primer used in the construction of a short consensus mutated Bacilius amyloliquefaciens alpha-amylase (amyQ) promoter gene expression cassette, used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Bacillus cell; tandem promoter; consensus promoter; polypeptide production; amyL promoter; amyQ promoter; aprH promoter; cryIIIA promoter; subtilisin Carlsberg gene promoter; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Producing a polypeptide in a Bacillus strain comprises cultivating a Bacillus cell, which contains a nucleic acid construct comprising a tandem promoter and consensus promoters

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel isolated polypeptide having pectin acetylesterase activity useful for degrading pectic substances and in degradation or modification of acetylated pectins and plant cell walls
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to Bacillus subtilis pectin acetylesterase protein. The invention is useful for degrading a pectic substance. It is also useful for degrading soluble and insoluble pectins with varying degrees of esterification. Clarification etc. The protein may be used alone or in combination with other enzymes for the degradation or modification of acetylated pectins, degradation or modification of acetylated pectins, degradation or modification of plant cell walls.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

```
amplification of a downstream portion (nucleotides 445-953,
where the A of the ATG start codon is +1) of the alpha-amylase
where the A of the ATG start codon is +1) of the alpha-amylase
amyg gene from Bacillus subtilis A 164 chromosomal DNA. Primer 19
includes Sfil and NotI sites. An upstream portion of the amyg gene
(nucleotides -421 to +77) was amplified using primers 17 and 18
cese ANV82399-4400. The 2 fragments were then spliced by PCR using
primers 17 and 20. A splicing by overlap extension (SoB) reaction
was performed to create a deleted version of the amyg gene and
cells having a deleted spoilAC gene, a deleted amyg gene and
deleted protease genes have been constructed. These can be used in
the production of heterologous polypeptides. The invention also
relates to Bacillus proteases (see AAW89547-48) suitable for use in
                                                                                                                                                                                                                                           Primers 19 and 20 (see AAV82401-02) are designed for use in the PCR
                                                                                                                                               Novel protease from Bacillus subtilis \text{LC20} - useful in laundry and dishwashing detergents and for leather processing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Producing polypeptides in Bacillus cells - which are modified to reduce production of surfactin, useful for, e.g. producing hormones
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 amyE gene; strain A164; mutant Bacillus; biosynthesis; surfactin;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  PCR primers AAV38593-94 and AAV38595-96 were used to amplify the different portions of the amyE gene of Bacillus subtilis strain A164. The portions were cloned to create a partially deleted amyE gene. This was used in the course of the invention. The specification describes the production of a polypeptide. This comprises culturing a mutant Bacillus that includes nucleic acid encoding the polypeptide and nucleic acid containing a modified form of at least 1 gene involved in biosynthesis of a surfactin or its isoforms. The mutant organism produces less surfactin, or isoform, than wild type Bacillus. The method may be used heterologous or homologous.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                                                                                           g
                                                                                                                                                                                                                                                2222×8
                                                                                                                                                                                                                                                            ö
                                           PCR primers AAV38593-94 and AAV38595-96 were used to amplify the different portions of the amyE gene of Bacillus subtilis strain A164. The portions were cloned to create a partially deleted amyE gene. This was used in the course of the invention. The specification describes the production of a polypeptide. This comprises culturing a mutant Bacillus that includes nucleic acid encoding the polypeptide and nucleic acid containing a modified form of at least 1 gene involved in biosynthesis of a surfactin or its isoforms. The mutant organism produces less to produce hormones, enzymes and receptors, which are either heterologous or homologous.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Primers 17 and 18 (see AAV82399-400) are designed for use in the PCR amplification of an upstream portion (nucleotides -421 to +77, where the A of the ATG start codon is +1) of the alpha-amylase amyE gene from Bacillus subtilis A164 chromosomal DNA. Primer 18 includes Sfil and NoII sites. A downstream portion of the amyE gene (nucleotides 445-953) was amplified using primers 19 and 20 (see primers 17 and 20. A splicing by overlap extension (SOE) reaction was performed to create a deleted version of the amyE gene. Mutant host cells having a deleted spoilAC gene, a deleted amyE gene and deleted protease genes have been constructed. These can be used in
                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel protease from Bacillus subtilis LC20 – useful in laundry and dishwashing detergents and for leather processing

The method is used to produce homologous or particularly heterologous proteins, particularly enzymes (specifically serine protease, maltogenic alpha-amylase and pullulanase), but also hormones, antibodies, reporters etc. The specified promoters provide increased expression of the sequence which encodes the polypeptide of the invention. After incorporation of the nucleic acid construct of the invention, any marker gene may be deleted, resulting in a cell that is preferred for environmental and regulatory regions. This sequence represents a pcr primer used to amplify the Bacillus licheniformis alpha-amylase amyL promoter which is used in the construction of an amyL promoter/Serine protease, SAVINASE (RTM) gene expression cassette described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Tandem promoter; consensus promoter; enzyme production; hormone; amyL,

Chote-Vector: lambda pSB; Site_1: BamHI; Site_2: ECORI; First strand cDNA was primed with an anchored strand cDNA was primed with an anchored strand cDNA was primed with a BamHI-dc primer Strand was primed with a BamHI-dc primer Strand was primed with a BamHI-dc primer [5'AGAGAGTCGGATCCGGCCCGAATAATAATAAT(C) 3']. Double-stranded cDNA was then digested with BamHI and XhoI and directionally cloned into the BamHI and SalI sites of lambda pSB vector. Library went through one cound of normalization. Library was constructed by Wei

plasmid pbi329 from E.coli k-12.
unidentified cloning vector
artificial sequence; vectors.
1 (bases 1 to 4150)
Covarruthas,L. and Bolivar,F.
Construction and characterization of new cloning vehicles: Vi. plasmid pbR329, a new derivative of pbR328 lacking the 482-base-pair inverted duplication
6ene 17, 79-89 (1982)
                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                  1425

Plasmid pITL comprises a base vector for novel humanised polynucleotide vectors. Such vectors comprise a human-derived polynucleotide vectors. Such vectors comprise a human-derived promoter or manmalian homologue which is functional in mammalian target tissue and cells and a sequence acceptance site (see AAV2175-36), which accepts CDNA products from RT-PCR cloning. They also contain minimal non-human components, such as a replication of the vector, is well as human-derived are necessary for production of the vector, as well as human-derived spid polyA sequences (see AAV21723). The novel vectors are used to express target antigens, especially tumour antigens. They are non-replicating in mammalian cells but are capable of extended stable expression of target sequences generating an immune response in immunised individuals. The vectors selectively elicit immune response to the target sequences with little or no immune response to the other components of the vectors. The target antigens are expressed as intracellular polypeptides or peptides and appropriately presented on antigen presenting cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ó

Plasmid pITL-hHER2/neu comprises base vector pITL (see AAV21724) and a human HER-2/neu nucleic sequence. pITL-hHER2/neu was used to evaluate the toxicity of anti-tumour vaccination in rats, and in phase I and phase II trials to evaluate polynucleotide vaccination in advanced breast cancer. Novel humanised vectors, which can be based on pITL, comprise a human-derived promoter or mammalian homologue which is functional in mammalian target tissue and cells and a sequence acceptance site which accepts cDNA products from RT-PCR cloning. The vectors are non-replicating in mammalian cells but are capable of extended stable expression of the target.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     components

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Ωp
Humanised polynucleotide vectors – comprising human derived promoter and sequence acceptance site, used for the production of vaccines
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Plasmid pITL-GFP comprises base vector pITL (see Anversor, humanised green fluorescent protein (GFP) reporter sequence (see AAV21725). Novel humanised vectors comprise a human-derived promoter or manmalian homologue which is functional in mammalian target tissue and cells and a sequence acceptance site which accepts cDNA products from RT-PCR cloning. pITL-GFP was used to examine the kinetics of expression of a reporter sequence from such vectors in an animal model (Fisher 344 rats). Toxicity from such vectors in an animal model (Fisher 344 rats). Toxicity from such vectors in an animal model (Fisher 344 rats).

                                                                                                                                                                                                                                                             Gaps
stable expression of target sequences generating an immune response in immunised individuals. The vectors selectively elicit immune response to the target sequences with little or no immune response to the other components of the vectors. The target antigens are expressed as intracellular polypeptides or peptides and, as such, are processed as self polypeptides or peptides and appropriately presented on antigen presenting cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    GGTGGGATCCCTGTGACCCTCCCCAGTGCCTCTCCTGGCCTGGAAGTTGCCACTCCAG

                                                                                                                                                                                     are non-replicating in mammalian cells but are capable of extended stable expression of target sequences generating an immune response responsed in immunised individuals. The vectors selectively elicit immune responses to the target sequences with little or no immune response to the other components of the vectors. The target antigens are expressed as intracellular polypeptides or peptides and, as such, are processed as self polypeptides or peptides and appropriately presented on antigen presenting cells.
                      in mammalian target tissue and cells and a sequence acceptance site (see AAV21735-36) which accepts CDNA products from RT-PCK cloning. They also contain minimal non-human components, such as a replication origin (see AAV21715) and selectable marker gene (see AAV21717-18) tare necessary for production of the vector. The novel vectors are used to express target antigens, especially tumour antigens. They are nor-replicating in mammalian cells but are capable of extended

Expression vector VlJneo.

```
The sequences given in AAQ74206-08 represent expression vectors which were used for the expression of influenza virus genes. VIJ contains the contains the amps gene and ViJneo contains the kank gene in the same orientation. DNA constructs such as these, containing the influenza virus genes are capable of inducing the expression of an antigenic influenza virus gene product which induces a specific immune response upon introduction of the DNA construct into animal tissue in vivo and resultant uptake of the DNA construct by cells which express the encoded influenza gene. The encoded influenza virus gene encodes nucleoprotein, hemaglutinin, polymerase, matrix or non-structural human influenza virus gene products. The virus gene is operably linked to one or more control sequences for incorporation in a vaccine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            2303

Vector pEe6FFBHCDR20 (AAT50962) comprises the TFBHCDR20 CDR-grafted heavy chain gene inserted into vector pEe6hCMV-BgIII. It encodes a CDR-grafted heavy chain (AAM10232) in which CDRs (see also AAW10222-24) from the mouse anti-tissue factor monoclonal antibody FFB-5G9 are grafted into a human KOL antibody framework. The heavy chain constant region is derived from human IgG4. Humanised antibodies are obtd. by cotransfecting a host cell with vectors encoding the CDR-grafted heavy and light chains (see also AAW1023). These antibodies are capable of inhibiting human tissue factor and can be

                                                                                                                                                                                                                                                                                                  Vector pEel2TFBLCDR3 (AAT50963) comprises the TFBLCDR3 CDR-grafted light chain gene inserted into vector pEel2. It encodes a CDR-grafted light chain (AAM10233) in which CDRs (see also AAW10225-27) from the mouse anti-tissue factor monoclonal antibody FTF8-5G9 are grafted into a human REI antibody framework. The constant region is from the human kappa C region. Humanised antibodies are obtd. by cotransfecting a host cell with vectors encoding the CDR-grafted light and heavy (see also AAW10232) chains. These antibodies are capable of inhibiting human tissue factor and can be used to treat e.g. intravascular coagulation, arterial restenosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

                                                                                                                                                                                                                                                                                                                                                                                        The specification describes a fusion protein, which comprises a Varicella Zoster Virus (VZV) gE protein or an immunologically active fragment, fused to a different protein of VZV. The fusion protein or nucleic acids encoding it can be used to prevent or ameliorate Varicella (chicken pox) or Zoster (shingles) infections. The present sequence represents the plasmid pNIV4801, evector which is used to express fusion proteins of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            892 ACACAGCCCAGCTTGGAGCGAACGACCTACACCGAACTGAGATACCTACAGCGTGAGCAT

This sequence represents the nucleotide sequence of the pEEL2 vector, pEel2 Combo BM 12, which contains the bl2 heavy and light chain genes. The pEEL2 vector has a human CMV promoter for expression of the light chain, a polylinker to provide cloning sites, and a polyadenylation signal for termination of transcription. The vector also contains the GS selectable marker gene whose expression is controlled by an SV40 early promoter at the 5' end of the GS gene, an intron, and a polyadenylation signal at the 3' end of the GS gene. A heavy chain cassette comprising the HCWV promoter, enhancer elements, heavy chain gene and polyadenylation signal were removed from the pEEG vector and inserted into the pEEL2 vector to generate the combinatorial construct containing both the bl2 light and heavy chain genes. The vector pEel2 combo BM 12 was used to transfect GNO cells and an antibody, bl2, was expressed. The resulting antibody has the capacity to reduce HIV infectivity titre in an in vivo virus infectivity assay by 50 % at a concentration of less than 700 mg of antibody/ml. The MAD may be used for determining immunocompetence of a human anti-HIV antibody and in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           772 CTGCTAATCCTGTTACCAGTGGCTGCTGCCAGTGGCGATAAGTCGTGTCTTACCGGGTTG 831
